While setting up the c/c++ development environment in Visual Studio code, I found a few difficulties during the installation and configuration process. Initially, I had some confusion while installing Visual Studio code and selected the add to path option during installation. I also found difficulty finding and installing the correct c/c++ extension by Microsoft from the extension market place. Another major issue by installing MinGW - 64 through MSU/SI and configuring the GCC compiler correctly. I was not sure which compiler package to install and where exactly the required file was located. I had to check the path setting and tested difficult because I was not familiar with window terminal command.
